

Retail Sales Performance Analysis

Project Overview

This project analyzes retail sales data to identify revenue trends, product performance, return patterns, and business growth opportunities using Python and data visualization techniques.

Tools Used

- Python
- Pandas
- Matplotlib
- Seaborn
- Google Colab

Dataset

The project uses retail sales datasets containing product-wise sales information and monthly sales records.

Key Findings

- Basket category generated the highest revenue.
- Art & Sculpture was the second highest-performing category.
- Basket and Art & Sculpture showed the highest return values.
- Several product categories recorded zero returns.
- Sales showed growth trends over time, with significant peaks during certain periods.
- Revenue was concentrated in a few high-performing product categories.

Visualizations

- Top Products by Net Sales
- Returns Analysis
- Monthly Sales Trends
- Correlation Heatmap

Conclusion

The analysis highlights high-performing product categories, return behavior, and sales growth patterns that can help businesses improve decision-making and optimize revenue generation.
